

**NAME**

which – locate a command

**SYNOPSIS**

which [-a] filename ...

**DESCRIPTION**

**which** returns the pathnames of the files (or links) which would be executed in the current environment, had its arguments been given as commands in a strictly POSIX-conformant shell. It does this by searching the PATH for executable files matching the names of the arguments. It does not canonicalize path names.

**OPTIONS**

**-a**        print all matching pathnames of each argument

**EXIT STATUS**

- 0**        if all specified commands are found and executable
- 1**        if one or more specified commands is nonexistent or not executable
- 2**        if an invalid option is specified
